Figure 1 consists of six sub-graphs labeled (a) through (f), each plotting a different parameter over a 100-minute period. The x-axis for all graphs is 'Time (min)' ranging from 0 to 100. The y-axis for all graphs is 'Arbitrary Units' ranging from 0 to 10. Graph (a) shows a sharp peak at 10 minutes. Graphs (b) through (f) show peaks at 10 minutes followed by a gradual decline.

Figure 1 consists of seven sub-diagrams labeled (a) through (g), each showing a graph with 10 nodes arranged in a grid-like pattern. The nodes are represented by small circles. The edges are represented by lines connecting the nodes. In each diagram, a subset of edges is highlighted with thicker lines, representing the current state of the algorithm. (a) shows the initial graph with 15 edges. (b) through (f) show the step-by-step addition of edges to the highlighted set, with some edges being rejected or added based on the algorithm's rules. (g) shows the final minimum spanning tree, which consists of 9 edges connecting all 10 nodes.

Figure 1. The effect of the concentration of the H_2O_2 solution on the amount of the released H_2O from the H_2O_2 -loaded hydrogel. The amount of the released H_2O was measured by the weight difference of the hydrogel before and after the release. The concentration of the H_2O_2 solution was 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, and 10 wt. %.

Figure 1 illustrates the experimental setup. A subject is seated at a table, viewing a video screen. A camera is positioned above the screen. A target is located on the screen. A horizontal line is drawn on the screen, representing the target position. The subject's hand is positioned at the starting point. The distance between the starting point and the target is labeled as D . The distance between the starting point and the horizontal line is labeled as L . The distance between the horizontal line and the target is labeled as $D-L$.

Figure 1. The effect of the concentration of the *Agrobacterium* suspension on the transformation efficiency of *Agrobacterium* strains. The *Agrobacterium* strains were incubated in the medium containing 100 mg/ml of tetracycline for 24 h. The cell concentration of the *Agrobacterium* strains was adjusted to 10⁶ cells/ml. The cell suspension was then mixed with the plant protoplasts and cocultured for 48 h. The transformation efficiency was determined by the number of GUS-positive cells per 10⁵ cells. The data were the mean of three independent experiments.
