Figure 1. The effect of the concentration of the *Agrobacterium* suspension on the transformation efficiency of *Agrobacterium* strains. The cells were grown in YEA medium at 28°C for 24 h. The cell concentration was determined by optical density at 600 nm. The cell suspension was adjusted to the desired concentration. The cells were then mixed with the plant tissue and cocultured for 48 h. The cells were then washed and the plant tissue was cultured on the selective medium. The transformation efficiency was determined by the number of transformants per 100 µg of plant tissue. The data are the mean ± SD of three independent experiments.

Figure 1. The effect of the concentration of the *Agrobacterium* suspension on the transformation efficiency of *Agrobacterium* strains. The *Agrobacterium* strains were grown in YEA medium for 24 h at 28 °C. The cell concentration was adjusted to 10⁸ cells/ml. The cells were then mixed with the plant tissue and the transformation efficiency was determined. The results are shown as the mean ± SD of three independent experiments. The transformation efficiency was significantly different from the control (p < 0.05) as determined by the Student's *t*-test.
