The schematic diagram illustrates the mechanism of action of anti-epileptic drugs (AEDs). It begins with a stimulus (S) triggering an action potential (AP). This process involves the opening of voltage-gated sodium channels (NaV) and calcium channels (CaV), which leads to the generation of APs. AEDs are shown binding to these channels, specifically NaV and CaV, to inhibit their function and thereby prevent the generation of APs. The AEDs depicted include phenytoin, carbamazepine, lamotrigine, and valproic acid.

The diagrams illustrate the stages of mitosis:

- a**: Prophase - Chromosomes are condensing and the nuclear envelope is breaking down.
- b**: Metaphase - Chromosomes are aligned at the metaphase plate.
- c**: Anaphase - Sister chromatids are separating and moving toward opposite poles.
- d**: Telophase - Nuclear envelopes are reforming around the two sets of chromosomes.
- e**: Cytokinesis - The cell is dividing into two daughter cells.

Figure 1. The effect of the concentration of the *Agrobacterium* suspension on the transformation efficiency of *Agrobacterium* strains. The number of transformed cells was determined by the number of colonies growing on the selective medium. The results are the mean of three independent experiments. Error bars represent the standard deviation.

Figure 1 consists of 18 line drawings illustrating the development of a chick embryo. The drawings are arranged in two columns. The left column contains drawings 1 through 10, and the right column contains drawings 11 through 18. Each drawing is labeled with a number and a brief description of the stage.
